(54) POSITION

STATION RADIOLOCATION MOBILE MEASUREMENT FOR

(57) Abstract:

plurality of wireless base stations. transmitted in a time series from a among distance measuring signals specified wireless base station from radiolocation mobile station with a receiving a return radio wave from a wave propagation is measured, by accuracy even when the state of radio PURPOSE: To achieve a higher

positions of radiolocation mobile CONSTITUTION: To measure upgrading of measuring accuracy. data thereby enabling further analysis based on three measurement station 1 through telephone circuits are collected to the wireless base excluding the wireless base station 1 wireless base stations 2 and 3 and 3. Measurement data at the control system to calculate distances system and a reception sequential transmission sequential control collated in delay based on a from the wireless base stations 1, 2 example, wireless base station 1 and a plurality of wireless base stations 1, and 3i from the radiolocation mobile 1L, 2L, 3L and the like to perform an the wireless base station 1 are then, distance measuring signals with the wireless base stations, for (specified wireless base station) of 2 and 3 are all received with any one radiolocation mobile stations M from 20 and 30 which are oscillated to the stations M for three ratio waves 10, stations M, return radio waves 1i, 2i
